

Specification

What I claim my invention is... is Quicker Hands is a ball controlling device that incorporates a hockey stick, that is attached to a safety cord, which is coupled to the blade portion of the hockey stick at one end of the safety cord. At the other end of the safety cord a ball is coupled. The impact surface, cord, and ball all cooperate to produce a fun toy to play with and a time saving device. The system helps individuals training to increase their hockey skills by improved ice and roller hockey ball or puck handling, shooting, and passing.

Because when the ball is misplayed the cord reacts by holding the ball in range. The blade and cord are designed to allow the ball to be moved quickly from side to side, the system uses the front and back sections of the blade for passing, stick handling and shooting.

An additional feature is the ability for the individuals to pass the ball to themselves by quickly by keeping the stick cupped, a rapid succession of passes can be made in a quick continuous manner. Alternatively, play with it just for the fun of it. The results are quicker hands, better hand eye coordination and longer practice sessions because it is fun to play with. Ball and puck handling, shooting, and passing are more fun because when the ball is misplayed it come right back.

The blade and cord sections allow the front and back sections to be used for stick handling and shooting while holding the ball in range.
